

Megamast DC

In cows during the dry period Antibacterial effect for 10 weeks

It is used in the treatment of infections associated with mastitis caused by Gram-positive and Gram-negative bacteria such as Streptococcus, Staphylococcus, Corynebacterium, and Escherichia coli.

Megamast DC

Intramammary Suspension
Bucket containing 48 tubes

Every 5g of product;
Cloxacillin (as benzathine) 600 mg
Ampicillin (as trihydrate) 300 mg

SINGLE APPLY

✓ It is used immediately after the last milking of a lactation to treat existing mastitis and protect against further infections during the dry period.

✓ After the last milking, a tube should be applied to each udder after the teat has been cleaned and disinfected.

✓ The tip of the syringe is placed in the teat opening, but not inside. When the plunger is pushed, the product reaches the udder tissue through the teat.
